Art Unit: 1744

### **DETAILED ACTION**

# This final action is in response to the amendment received on 03/20/2006 Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
  - 1. Determining the scope and contents of the prior art.
  - 2. Ascertaining the differences between the prior art and the claims at issue.
  - 3. Resolving the level of ordinary skill in the pertinent art.
  - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 52, 55-56, 62, 64-66, 69-70, 76, 78-80, 83-84, 90 and 92-93 are rejected 4. under 35 U.S.C. 103(a) as being unpatentable over Petri (EP 0842 605 A1) in view of Belfer et al (U.S.P.N. 6,106,854).

Page 3

With respect to claims 52, 66 and 80, the Petri reference discloses a method (page 3, numbered lines 20-21) for spraying a disinfectant composition (page 3, lines 22-23) in aerosol form (page 9, numbered lines 53-54) on inanimate surfaces (page 10, numbered lines 2-10) that includes the following: about 11% by volume of hydrogen peroxide (page 3, numbered lines 44-45 and converting 15% by weight using the density value for hydrogen peroxide at 20 degree Celsius to be 1.45 g/ml), about 12% by volume of Geraniol as antimicrobial active of essential oil (page 3, numbered lines 47-48 and page 4, numbered line 3 and converting 10% by weight using the density value of Geraniol to be 0.877 g/ml), about 9% by volume of polyacrylic acid as shear thinning polymeric thickener (page 4, numbered lines 10-11, page 4, numbered line 21, page 5, numbered lines 1-3 and converting 10% by weight using the density value for polyacrylic acid of 1.09 g/ml), about 3% by volume of malonic acid as an optional ingredient chelating agent (page 8, numbered lines 52-57 and converting 5% by weight using the density value for malonic acid to be 1.619 g/ml), about 4% by volume of catechol as an optional ingredient radical scavenger (page 9, numbered lines 2, page 9, numbered line 7, page 9, numbered lines 13-15 and converting 5% by weight using the density value for catechol to be 1.3 g/ml), 13% by volume of ethanol as an optional ingredient solvent (page 9, numbered lines 26-27 and converting 10% by weight using the density value for ethanol at 20 degree Celsius to be 0.79 g/ml, equivalent to the

**Art Unit: 1744** 

flash vaporization component having two carbon atoms) and about 47% by volume of water up to 100% (page 5, numbered lines 45-46). For example, density of Hydrogen peroxide at 20 degree Celsius is 1.45 g/ml. (15g) x (1/1.45 ml/g) = 10 ml. The Petri reference further teaches that upon spraying the composition onto a hard surface, no residues (page 10, numbered lines 11-13) are left (equivalent to leaving an essentially dry surface having anti-microbial agent deposited upon). The Petri reference further teaches that the compositions are packaged in spray dispensing containers (page 9. numbered lines 37-54) that intrinsically include spray nozzles for spraying the composition onto hard surfaces in an aerosol form. However, with respect to claims 52. 66 and 80, the Petri reference fails to teach higher concentration values for ethanol. The Belfer reference, which is in the art of designing aqueous hard surface disinfectant compositions that include hydrogen peroxide, teaches the concentration range for ethanol is between 35.0-50.0% by weight (col.4, lines 17-23). For example, based on the Petri composition explained above, 44% by volume of ethanol as an optional ingredient solvent (page 9, numbered lines 26-27 and converting 35% by weight using the density value for ethanol at 20 degree Celsius to be 0.79 g/ml, equivalent to the flash vaporization component having two carbon atoms) and about 20% by volume of water up to 100% (page 5, numbered lines 45-46). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to increase the concentration of ethanol of the Petri reference as taught by the Belfer reference since ethanol acts as a biocide agent (col.10, lines 11-60 and tables 2-4)

Art Unit: 1744

thereby adding more of ethanol to Petri's composition would magnifies its biocidal properties.

With respect to claims 55-56, 69-70 and 83-84, the Petri reference teaches including ethanol (page 9, numbered lines 26-27) in the disinfectant composition.

With regard to claims 62, 76 and 90, the Petri reference discloses a method (page 3, numbered lines 20-21) for spraying a disinfectant composition (page 3, lines 22-23) in aerosol form (page 9, numbered lines 53-54) on inanimate surfaces (page 10, numbered lines 2-10) that includes about 11% by volume of hydrogen peroxide (page 3, numbered lines 44-45 and converting 15% by weight using the density value for hydrogen peroxide at 20 degree Celsius to be 1.45 g/ml).

With respect to claims 64-65, 78-79 and 92-93, the Petri reference teaches including ethanol (page 9, numbered lines 26-27) in the disinfectant composition.

## Response to Arguments

5. Applicant's arguments filed on 03/20/2006 have been fully considered but they are not persuasive.

The Belfer reference (newly applied reference), which is in the art of designing aqueous hard surface disinfectant compositions that include hydrogen peroxide, teaches the concentration range for ethanol is between 35.0-50.0% by weight (col.4, lines 17-23). For example, based on the Petri composition explained above, 44% by volume of ethanol as an optional ingredient solvent (page 9, numbered lines 26-27 and converting 35% by weight using the density value for ethanol at 20 degree Celsius to be

Art Unit: 1744

0.79 g/ml, equivalent to the flash vaporization component having two carbon atoms) and about 20% by volume of water up to 100% (page 5, numbered lines 45-46).

Page 6

On page 7 of the Remarks section, applicant argues that the Petri reference teaches the use of ingredients such as antimicrobial actives of essential oils, polymeric thickeners and optional surfactants which do not vaporize quickly. The examiner disagrees. With regard to essential oils, optional polymeric thickeners and optional surfactants, their inclusion does not mean that the composition of the Petri reference is not a flash-dry composition. In fact, on page 10, numbered lines 11-13, the Petri reference teaches that upon spraying the composition onto a hard surface, no residues are left (equivalent to leaving an essentially dry surface having anti-microbial agent deposited upon).

#### Conclusion

- 6. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).
- 7. A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Application/Control Number: 09/770,518

Art Unit: 1744

. . . .

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to MONZER R. CHORBAJI whose telephone number is (571) 272-1271. The examiner can normally be reached on M-F 9:00-5:30.

- **9.** If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, GLADYS J. CORCORAN can be reached on (571) 272-1214. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
- 10. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
